1 Metabolic Network Reconstruction Tutorial

In the following tutorial you will learn how to manipulate a (genome-scale) constraint-based metabolic reconstruction with [cobrapy](#) such that you can conform with the recommendations of **Box 2 in the manuscript on community standards**.

From the caption of **Box 2** itself:

Proposed minimum standardized content for a metabolic network reconstruction. We propose that modelers use this list as a guide to help standardize accessibility, content, and quality; however, more comprehensive documentation and more interpretable and accessible information can only improve the usability and biological relevance of the shared reconstruction.

Throughout this tutorial we will look at and improve the example reconstruction `iPfal19.xml` for *Plasmodium falciparum* 3D7 provided with the publication, as well as building a minimal example from scratch where you can easily see the generated SBML. Each section will show:

1. Python code needed for the inspection and manipulation of a metabolic reconstruction.
2. Excerpts from the resulting [SBML](#) that is generated by cobrapy when saving your model.

A Note on Terminology

In the COBRA community, usually a distinction is made between a *reconstruction* and a *model*. A *reconstruction* represents the bare metabolic network of biochemical reactions that may occur in an organism due to the catalytic action of enzymes encoded in the genome plus some spontaneous reactions. A *model* is then a specification (or parametrization) of a reconstruction by, for example, defining certain medium conditions, i.e., restricting uptake rates; by fixing the directionality of certain reactions to fit those conditions; and by introducing specific energetic maintenance costs of the organism in those conditions. Other forms of model parametrization exist but these are some typical examples.

This is the consensus within the community, however, both the SBML element to encode the metabolic network and the cobrapy class are called *model*. They do not make an explicit distinction between those two representations. Within this tutorial we will therefore loosely call everything a model.

```
[1]: import logging
```

```
[2]: logging.basicConfig(level="INFO")
```

```
[3]: import cobra
      from cobra.io import read_sbml_model, write_sbml_model
```

The tutorial was created with the following software versions.

```
[4]: cobra.show_versions()
```

System Information

=====

```
OS           Darwin
OS-release   17.3.0
Python       3.7.3
```

Package Versions

=====

```
cobra                0.16.0
depinfo              1.5.1
future               0.17.1
numpy                1.17.0
optlang              1.4.4
pandas               0.25.0
pip                  19.2.2

wheel                0.33.4
```

1.1 Model

Load the existing metabolic model.

```
[5]: p_falciparum = read_sbml_model("iPfal19.xml")
```

Every object including a model, and its subcomponents (genes, metabolites, and reactions) have shared fields that can be very useful: ‘id’, ‘name’, ‘notes’ and ‘annotation’. We will get to the ‘id’ and ‘name’ fields in the next section.

It is important to note that the ‘notes’ field is intended for SBML notes, not human-readable information. We recommend putting ‘notes to self’ or other human readable information in the annotation field, and specifically the ‘description’ subfield.

```
[6]: p_falciparum.annotation["description"]
```

```
[6]: 'This model is the third iteration of the asexual blood-stage Plasmodium
falciparum 3D7 genome-scale metabolic network reconstruction. The original
reconstruction was generated using a custom pipeline by Plata et al (DOI:
10.1038/msb.2010.60) from P. falciparum Dd2 genome and curated to P. falciparum
3D7 and Dd2 function. Multiple rounds of curation were conducted (DOI:
10.1186/s12864-017-3905-1,10.1186/s12859-019-2756-y, and unpublished by Maureen
Carey). Gene IDs can be mapped to sequences on https://plasmodb.org/ and
reaction and metabolite nomenclature maps to data on http://bigg.ucsd.edu/.'
```

The 'annotation' field includes general information about the object to map to other databases or relevant information. We'll discuss this field more throughout this tutorial.

```
[7]: p_falciparum.annotation
```

```
[7]: {'sbo': 'SBO:0000624',
'taxonomy': '36329',
'genome': 'https://plasmodb.org/common/downloads/Current_Release/Pfalciparum3D7
/fasta/data/PlasmoDB-44_Pfalciparum3D7_Genome.fasta',

(DOI: 10.1186/s12864-017-3905-1,10.1186/s12859-019-2756-y, and unpublished by
Maureen Carey). Gene IDs can be mapped to sequences on https://plasmodb.org/ and
reaction and metabolite nomenclature maps to data on http://bigg.ucsd.edu/.'}
```

Here, we create an empty (i.e. small) model that lets us easily inspect generated SBML.

```
[8]: bare = cobra.Model("bare", name="Empty Demo Model")
```

Simply saving an empty model with an identifier and name to SBML

```
write_sbml_model(bare, "bare.xml")
```

will generate the following SBML element:

```
<model metaid="meta_bare" id="bare" name="Empty Demo Model" fbc:strict="true">
```

Please be aware that, by convention, genome-scale metabolic network models are expected to have at least two compartments: the cytosol and extracellular space. At the moment, support for compartments in cobrapy is a bit weak. You can only create them by referencing them from a metabolite or by loading an existing SBML model. Better support for compartments [is in preparation](#).

In their simplest form, compartments are defined as follows in SBML:

```
<compartment id="c" name="cytosol" constant="true"/>
```

You can inspect existing compartments with cobrapy as follows:

```
[9]: p_falciparum.compartments
```

```
[9]: {'cytosol': 'c',  
      'extracellular': 'e',  
      'apicoplast': 'ap',  
      'mitochondria': 'm',  
      'food_vacuole': 'fv'}
```

These compartment abbreviations will be added as a suffix to each metabolite to describe its location.

1.1.1 Recognized naming convention

The existing model iPfal17 follows the recommended practice for model identifiers. Quoted from **Box 2**:

recommended approach: i + species indicator + iteration identifier, e.g., iPfal17 for *P. falciparum* published in 2017

Let us inspect this from Python.

```
[10]: p_falciparum.id
```

```
[10]: 'iPfal19_v1'
```

```
[11]: p_falciparum.name
```

```
[11]: 'iPfal19'
```

iPfal19_v1 = *P. falciparum* reconstruction published in (hopefully) 2019, version 1

1.1.2 Machine-readable reference to organism and species embedded via MIRIAM annotation

We can find good information about a sequenced species at NCBI. *Plasmodium falciparum* 3D7 is described [here](#). However, note that the author specifies that the genome was obtained from a different source:

```
[12]: p_falciparum.annotation['genome']
```

```
[12]: 'https://plasmodb.org/common/downloads/Current_Release/Pfalciparum3D7/fasta/data/PlasmoDB-44_Pfalciparum3D7_Genome.fasta'
```

We can dynamically change this information. We will demonstrate how to update this information in the following steps in our bare model so that both the model is correct and you can easily navigate the resulting SBML.

```
[13]: p_falciparum.annotation["taxonomy"] = "36329"
      bare.annotation["taxonomy"] = "36329"
```

This ensures that the reconstruction's taxonomy is annotated. The `annotation` attribute is a Python dictionary whose key-value pairs are automatically converted to MIRIAM compatible URIs. In order for this to work correctly, please first verify the exact spelling of the registry key on identifiers.org.

```
<annotation>
  <rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#" xmlns:dcterms="http://p
    <rdf:Description rdf:about="#meta_bare">
      <bqbiol:is>
        <rdf:Bag>
          <rdf:li rdf:resource="https://identifiers.org/taxonomy/36329"/>
        </rdf:Bag>
      </bqbiol:is>
    </rdf:Description>
  </rdf:RDF>
</annotation>
```

Important elements here are the description which is about the `model` element due to the `metaid` (compare with section Section 1.1).

```
<rdf:Description rdf:about="#meta_bare">
```

The next important element is the biological qualifier

```
<bqbiol:is>
```

you can find out more about its meaning at combine and BioModels.

Finally, there is one MIRIAM compliant annotation that was generated by cobrapy.

```
<rdf:li rdf:resource="https://identifiers.org/taxonomy/36329"/>
```

1.1.3 NCBI reference genome

The genome assembly for *Plasmodium falciparum* 3D7 is described [here](#).

```
[14]: bare.annotation["insdc.gca"] = "GCA_000002765.2"
```

Which leads to the following new SBML element:

```
<rdf:li rdf:resource="https://identifiers.org/insdc.gca/GCA_000002765.2"/>
```

However, you'll notice that this field ("insdc.gca") is not in the p_falciparum model.

```
[15]: p_falciparum.annotation
```

```
[15]: {'sbo': 'SB0:0000624',
      'taxonomy': '36329',
      'genome': 'https://plasmodb.org/common/downloads/Current_Release/Pfalciparum3D7/
      fasta/data/PlasmoDB-44_Pfalciparum3D7_Genome.fasta',
      'doi': 'DOI:pending',
      'authors': 'Maureen Carey, mac9jc@virginia.edu',
      'species': 'Plasmodium falciparum',
      'strain': '3D7',
      'tissue': 'parasite in the asexual blood-stage',
      'terms_of_distribution': 'CC-BY',
      'curation': ['DOI: 10.1038/msb.2010.60',
      'DOI: 10.1186/s12864-017-3905-1',
      'DOI: 10.1186/s12859-019-2756-y',
      'unpublished by Maureen Carey'],
      'genedb': 'Pfalciparum',
      'description': 'This model is the third iteration of the asexual blood-stage
      Plasmodium falciparum 3D7 genome-scale metabolic network reconstruction. The
      original reconstruction was generated using a custom pipeline by Plata et al
      (DOI: 10.1038/msb.2010.60) from P. falciparum Dd2 genome and curated to P.
      falciparum 3D7 and Dd2 function. Multiple rounds of curation were conducted
      (DOI: 10.1186/s12864-017-3905-1,10.1186/s12859-019-2756-y, and unpublished by
      Maureen Carey). Gene IDs can be mapped to sequences on https://plasmodb.org/ and
      reaction and metabolite nomenclature maps to data on http://bigg.ucsd.edu/.'}

```

This is because the genome was acquired via a field-specific database and was manually curated with RNA-Seq and proteomics data.

```
[16]: p_falciparum.annotation["genome"]
```

```
[16]: 'https://plasmodb.org/common/downloads/Current_Release/Pfalciparum3D7/fasta/data
      /PlasmoDB-44_Pfalciparum3D7_Genome.fasta'
```

Let's add this information to increase the clarity of this process.

```
[17]: p_falciparum.annotation["description"] = p_falciparum.
      ↪annotation["description"]+' Please note, the genome used for model_
      ↪construction was manually curated with RNA-Seq adn proteomics data by_
      ↪experts in the field and stored on a field specific database.'
      p_falciparum.annotation["description"]
```

```
[17]: 'This model is the third iteration of the asexual blood-stage Plasmodium
      falciparum 3D7 genome-scale metabolic network reconstruction. The original
      reconstruction was generated using a custom pipeline by Plata et al (DOI:
      10.1038/msb.2010.60) from P. falciparum Dd2 genome and curated to P. falciparum

```

3D7 and Dd2 function. Multiple rounds of curation were conducted (DOI: 10.1186/s12864-017-3905-1, 10.1186/s12859-019-2756-y, and unpublished by Maureen Carey). Gene IDs can be mapped to sequences on <https://plasmodb.org/> and reaction and metabolite nomenclature maps to data on <http://bigg.ucsd.edu/>. Please note, the genome used for model construction was manually curated with RNA-Seq and proteomics data by experts in the field and stored on a field specific database.'

The namespace for gene identifiers can be found here:

```
[18]: p_falciparum.annotation["genedb"]
```

```
[18]: 'Pfalciiparum'
```

However, this string ('Pfalciiparum') is not compliant with identifiers.org, so we will replace it with the correct version.

```
[19]: p_falciparum.annotation["genedb"] = 'Plasmodium_falciparum_3D7'  
bare.annotation["genedb"] = 'Plasmodium_falciparum_3D7'
```

This generates the following familiar element:

```
<rdf:li rdf:resource="https://identifiers.org/genedb/Plasmodium_falciparum_3D7"/>
```

1.1.4 Author(s) contact information embedded

Author information should be encoded as **VCards**. You can find more information in sections 6.6 and 6.7 in the [SBML level 3, release 2 specification](#). At the time of writing this tutorial, `cobrapy` lacks direct support to encode author information as VCards, however, if you manually edit the SBML as per the specification, `cobrapy` will respect and maintain this information.

```
[20]: # what it should be:  
#p_falciparum.annotation["authors"] = [  
#{"familyName": "Carey", "givenName": "Maureen", "organisation": "University of  
→Virginia", "email": "mac9jc@virginia.edu"},  
#{"familyName": "Untaroiu", "givenName": "Ana", "organisation": "University of  
→Virginia", "email": "amu4pv@virginia.edu"},  
#{"familyName": "Plata", "givenName": "German", "organisation": "Columbia  
→University", "email": "gap2118@columbia.edu"}]
```

```
[21]: p_falciparum.annotation["authors"]
```

```
[21]: 'Maureen Carey, mac9jc@virginia.edu'
```

Additionally, you can write more free-form text into the model's notes field.

```
[22]: bare.notes["Authors"] = "Tricia McMillan, Marvin, God"
```

1.2 Metabolite

A Note on Terminology

A tangent on the term *metabolite*: In the field of metabolic modeling four different terms are often used without clear distinction. There are compounds, chemicals, metabolites, and species. For the purpose of this document, we say ‘metabolite’ or ‘species’ to mean the most representative (most common) [tautomer](#) at the given pH. Implicitly, this acknowledges that interconvertible groups of tautomers may participate in a reaction. We will use ‘compound’ or ‘chemical’ to mean an exact chemical representation only.

An excellent resource for metabolites is [MetaNetX](#). It merges information from several source databases (among them [KEGG](#), [ChEBI](#), [BiGG](#)) and aims to provide consistent cross references. At the time of writing, there is information on around 700 k compounds in MetaNetX.

For this tutorial, we will look at [1-dodecanoyl-sn-glycerol 3-phosphate](#). On the referenced page you can see that a lot of information that we will need is directly provided for us.

When creating a metabolite identifier, we should be aware of several conventions. As noted before, every metabolite must be allocated to a compartment. Here, we reference the cytosol by its short identifier "c". Since the same metabolite can appear in multiple compartments, it is common practice to add the compartment as a suffix to the identifier of the metabolite. Thus making the identifier unique within the model.

In principle, a metabolite identifier can be any string that satisfies the SBML constraints (which can be expressed by the following regular expression `[a-zA-Z_][a-zA-Z_0-9]*`). However, many modelers choose BiGG identifiers because they often resemble their common names and are thus easier to reason about quickly. We will use this convention here.

```
[23]: metabolite = cobra.Metabolite(id="1ddecg3p_c", compartment="c")
```

Please note that the metabolite identifier starts with a digit which is against the SBML specification. Luckily for us, cobrapy uses a general `M_` prefix for all metabolites when writing SBML to prevent these cases. In most cases, this is the right default choice but you may prefer different behavior. In those cases you will have to manually adjust the default replacement functions of `cobra.io.write_sbml_model`.

```
[24]: bare.add_metabolites([metabolite])
```

When we add the metabolite to the model it produces the following SBML:

```
<species id="M_1ddecg3p_c" compartment="c" hasOnlySubstanceUnits="false" boundaryCondition="fa
```

You can check the existence of a metabolite in a given model in two ways

```
[25]: p_falciparum.metabolites.get_by_id("1ddecg3p_c")
```

```
[25]: <Metabolite 1ddecg3p_c at 0x1168e94a8>
```

If the metabolite identifier conforms with the above regular expression, there is also a short-hand version.

```
[26]: p_falciiparum.metabolites.glc__D_c
```

```
[26]: <Metabolite glc__D_c at 0x1169e84e0>
```

1.2.1 Human readable, descriptive name

The full names are used when displaying more information about a metabolite. This is very helpful when the identifier is rather hard to guess, as is the case for our example, and it will often be the only identifying piece of information that biologists can work with.

```
[27]: metabolite.name = "1-dodecanoyl-sn-glycerol 3-phosphate"
```

We have seen above that the names within the `iPfal17` model are formatted a bit strangely. A curation task for the model would be to clean up those names, for example, by using information from MetaNetX.

1.2.2 Charge

The metabolite charge is defined in the SBML package flux-balance constraints (fbc). In most cases the charge should be an integer although the upcoming version 3 of the fbc also allows real numbers for the charge to cover certain edge cases.

```
[28]: metabolite.charge = -2
```

1.2.3 Chemical formula

The formula is also an fbc extension attribute.

```
[29]: metabolite.formula = "C15H29O7P"
```

1.2.4 InChI strings

The [InChI](#) is a very information rich, unique description of a compound. In `cobrapy` we can provide it as an annotation to the metabolite.

```
[30]: metabolite.annotation["inchi"] = "InChI=1S/C15H31O7P/  
    ↪c1-2-3-4-5-6-7-8-9-10-11-15(17)21-12-14(16)13-22-23(18,19)20/  
    ↪h14,16H,2-13H2,1H3,(H2,18,19,20)/p-2/t14-/m1/s1"
```

1.2.5 At least one database identifier from a reliable resource

It might seem annoying and boring work but really: the more the merrier. When manually curating a model, keep in mind that it is relatively easy to add all of the annotations for one metabolite or

reaction at a time. It is much harder to add annotations for hundreds of metabolites and reactions after the fact (e.g. explore *p_falciparum*).

Fortunately, there are also tools that can help you automate this process! But, they might also introduce subtle mistakes.

More cross references are better because:

1. There are no one-to-one mappings of identifiers between identifiers and the more you use the better determined your metabolite is.
2. Other users of your model will have data in a myriad of formats. They will thank you deeply, if the identifier namespace of their data already exists in the model.

```
[31]: metabolite.annotation["bigg.metabolite"] = "1ddecg3p"  
metabolite.annotation["chebi"] = "CHEBI:62840"  
metabolite.annotation["hmdb"] = "HMDB62319"  
metabolite.annotation["seed.compound"] = "cpd15325"  
metabolite.annotation["metacyc.compound"] = "CPD0-2200"
```

After adding all of this information, the metabolite SBML definition looks like:

```
<species metaid="meta_M_1ddecg3p_c" id="M_1ddecg3p_c" name="1-dodecanoyl-sn-glycerol 3-phosphate"  
  <annotation>  
    <rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#" xmlns:dcterms="http://purl.org/dc/terms/">  
      <rdf:Description rdf:about="#meta_M_1ddecg3p_c">  
        <bqbiol:is>  
          <rdf:Bag>  
            <rdf:li -1195-1196-1197-1198-1199-1200-1201-1202-1203-1204-1205-1206-1207-1208-1209-1210-1211-1212-1213-1214-1215-1216-1217-1218-1219-1220-1221-1222-1223-1224-1225-1226-1227-1228-1229-1230-1231-1232-1233-1234-1235-1236-1237-1238-1239-1240-1241-1242-1243-1244-1245-1246-1247-1248-1249-1250-1251-1252-1253-1254-1255-1256-1257-1258-1259-1260-1261-1262-1263-1264-1265-1266-1267-1268-1269-1270-1271-1272-1273-1274-1275-1276-1277-1278-1279-1280-1281-1282-1283-1284-1285-1286-1287-1288-1289-1290-1291-1292-1293-1294-1295-1296-1297-1298-1299-1300-1301-1302-1303-1304-1305-1306-1307-1308-1309-1310-1311-1312-1313-1314-1315-1316-1317-1318-1319-1320-1321-1322-1323-1324-1325-1326-1327-1328-1329-1330-1331-1332-1333-1334-1335-1336-1337-1338-1339-1340-1341-1342-1343-1344-1345-1346-1347-1348-1349-1350-1351-1352-1353-1354-1355-1356-1357-1358-1359-1360-1361-1362-1363-1364-1365-1366-1367-1368-1369-1370-1371-1372-1373-1374-1375-1376-1377-1378-1379-1380-1381-1382-1383-1384-1385-1386-1387-1388-1389-1390-1391-1392-1393-1394-1395-1396-1397-1398-1399-1400-1401-1402-1403-1404-1405-1406-1407-1408-1409-1410-1411-1412-1413-1414-1415-1416-1417-1418-1419-1420-1421-1422-1423-1424-1425-1426-1427-1428-1429-1430-1431-1432-1433-1434-1435-1436-1437-1438-1439-1440-1441-1442-1443-1444-1445-1446-1447-1448-1449-1450-1451-1452-1453-1454-1455-1456-1457-1458-1459-1460-1461-1462-1463-1464-1465-1466-1467-1468-1469-1470-1471-1472-1473-1474-1475-1476-1477-1478-1479-1480-1481-1482-1483-1484-1485-1486-1487-1488-1489-1490-1491-1492-1493-1494-1495-1496-1497-1498-1499-1500-1501-1502-1503-1504-1505-1506-1507-1508-1509-1510-1511-1512-1513-1514-1515-1516-1517-1518-1519-1520-1521-1522-1523-1524-1525-1526-1527-1528-1529-1530-1531-1532-1533-1534-1535-1536-1537-1538-1539-1540-1541-1542-1543-1544-1545-1546-1547-1548-1549-1550-1551-1552-1553-1554-1555-1556-1557-1558-1559-1560-1561-1562-1563-1564-1565-1566-1567-1568-1569-1570-1571-1572-1573-1574-1575-1576-1577-1578-1579-1580-1581-1582-1583-1584-1585-1586-1587-1588-1589-1590-1591-1592-1593-1594-1595-1596-1597-1598-1599-1600-1601-1602-1603-1604-1605-1606-1607-1608-1609-1610-1611-1612-1613-1614-1615-1616-1617-1618-1619-1620-1621-1622-1623-1624-1625-1626-1627-1628-1629-1630-1631-1632-1633-1634-1635-1636-1637-1638-1639-1640-1641-1642-1643-1644-1645-1646-1647-1648-1649-1650-1651-1652-1653-1654-1655-1656-1657-1658-1659-1660-1661-1662-1663-1664-1665-1666-1667-1668-1669-1670-1671-1672-1673-1674-1675-1676-1677-1678-1679-1680-1681-1682-1683-1684-1685-1686-1687-1688-1689-1690-1691-1692-1693-1694-1695-1696-1697-1698-1699-1700-1701-1702-1703-1704-1705-1706-1707-1708-1709-1710-1711-1712-1713-1714-1715-1716-1717-1718-1719-1720-1721-1722-1723-1724-1725-1726-1727-1728-1729-1730-1731-1732-1733-1734-1735-1736-1737-1738-1739-1740-1741-1742-1743-1744-1745-1746-1747-1748-1749-1750-1751-1752-1753-1754-1755-1756-1757-1758-1759-1760-1761-1762-1763-1764-1765-1766-1767-1768-1769-1770-1771-1772-1773-1774-1775-1776-1777-1778-1779-1780-1781-1782-1783-1784-1785-1786-1787-1788-1789-1790-1791-1792-1793-1794-1795-1796-1797-1798-1799-1800-1801-1802-1803-1804-1805-1806-1807-1808-1809-1810-1811-1812-1813-1814-1815-1816-1817-1818-1819-1820-1821-1822-1823-1824-1825-1826-1827-1828-1829-1830-1831-1832-1833-1834-1835-1836-1837-1838-1839-1840-1841-1842-1843-1844-1845-1846-1847-1848-1849-1850-1851-1852-1853-1854-1855-1856-1857-1858-1859-1860-1861-1862-1863-1864-1865-1866-1867-1868-1869-1870-1871-1872-1873-1874-1875-1876-1877-1878-1879-1880-1881-1882-1883-1884-1885-1886-1887-1888-1889-1890-1891-1892-1893-1894-1895-1896-1897-1898-1899-1900-1901-1902-1903-1904-1905-1906-1907-1908-1909-1910-1911-1912-1913-1914-1915-1916-1917-1918-1919-1920-1921-1922-1923-1924-1925-1926-1927-1928-1929-1930-1931-1932-1933-1934-1935-1936-1937-1938-1939-1940-1941-1942-1943-1944-1945-1946-1947-1948-1949-1950-1951-1952-1953-1954-1955-1956-1957-1958-1959-1960-1961-1962-1963-1964-1965-1966-1967-1968-1969-1970-1971-1972-1973-1974-1975-1976-1977-1978-1979-1980-1981-1982-1983-1984-1985-1986-1987-1988-1989-1990-1991-1992-1993-1994-1995-1996-1997-1998-1999-2000-2001-2002-2003-2004-2005-2006-2007-2008-2009-2010-2011-2012-2013-2014-2015-2016-2017-2018-2019-2020-2021-2022-2023-2024-2025-2026-2027-2028-2029-2030-2031-2032-2033-2034-2035-2036-2037-2038-2039-2040-2041-2042-2043-2044-2045-2046-2047-2048-2049-2050-2051-2052-2053-2054-2055-2056-2057-2058-2059-2060-2061-2062-2063-2064-2065-2066-2067-2068-2069-2070-2071-2072-2073-2074-2075-2076-2077-2078-2079-2080-2081-2082-2083-2084-2085-2086-2087-2088-2089-2090-2091-2092-2093-2094-2095-2096-2097-2098-2099-2100-2101-2102-2103-2104-2105-2106-2107-2108-2109-2110-2111-2112-2113-2114-2115-2116-2117-2118-2119-2120-2121-2122-2123-2124-2125-2126-2127-2128-2129-2130-2131-2132-2133-2134-2135-2136-2137-2138-2139-2140-2141-2142-2143-2144-2145-2146-2147-2148-2149-2150-2151-2152-2153-2154-2155-2156-2157-2158-2159-2160-2161-2162-2163-2164-2165-2166-2167-2168-2169-2170-2171-2172-2173-2174-2175-2176-2177-2178-2179-2180-2181-2182-2183-2184-2185-2186-2187-2188-2189-2190-2191-2192-2193-2194-2195-2196-2197-2198-2199-2200-2201-2202-2203-2204-2205-2206-2207-2208-2209-2210-2211-2212-2213-2214-2215-2216-2217-2218-2219-2220-2221-2222-2223-2224-2225-2226-2227-2228-2229-2230-2231-2232-2233-2234-2235-2236-2237-2238-2239-2240-2241-2242-2243-2244-2245-2246-2247-2248-2249-2250-2251-2252-2253-2254-2255-2256-2257-2258-2259-2260-2261-2262-2263-2264-2265-2266-2267-2268-2269-2270-2271-2272-2273-2274-2275-2276-2277-2278-2279-2280-2281-2282-2283-2284-2285-2286-2287-2288-2289-2290-2291-2292-2293-2294-2295-2296-2297-2298-2299-2300-2301-2302-2303-2304-2305-2306-2307-2308-2309-2310-2311-2312-2313-2314-2315-2316-2317-2318-2319-2320-2321-2322-2323-2324-2325-2326-2327-2328-2329-2330-2331-2332-2333-2334-2335-2336-2337-2338-2339-2340-2341-2342-2343-2344-2345-2346-2347-2348-2349-2350-2351-2352-2353-2354-2355-2356-2357-2358-2359-2360-2361-2362-2363-2364-2365-2366-2367-2368-2369-2370-2371-2372-2373-2374-2375-2376-2377-2378-2379-2380-2381-2382-2383-2384-2385-2386-2387-2388-2389-2390-2391-2392-2393-2394-2395-2396-2397-2398-2399-2400-2401-2402-2403-2404-2405-2406-2407-2408-2409-2410-2411-2412-2413-2414-2415-2416-2417-2418-2419-2420-2421-2422-2423-2424-2425-2426-2427-2428-2429-2430-2431-2432-2433-2434-2435-2436-2437-2438-2439-2440-2441-2442-2443-2444-2445-2446-2447-2448-2449-2450-2451-2452-2453-2454-2455-2456-2457-2458-2459-2460-2461-2462-2463-2464-2465-2466-2467-2468-2469-2470-2471-2472-2473-2474-2475-2476-2477-2478-2479-2480-2481-2482-2483-2484-2485-2486-2487-2488-2489-2490-2491-2492-2493-2494-2495-2496-2497-2498-2499-2500-2501-2502-2503-2504-2505-2506-2507-2508-2509-2510-2511-2512-2513-2514-2515-2516-2517-2518-2519-2520-2521-2522-2523-2524-2525-2526-2527-2528-2529-2530-2531-2532-2533-2534-2535-2536-2537-2538-2539-2540-2541-2542-2543-2544-2545-2546-2547-2548-2
```

```
sboTerm="SBO:0000247"
```

1.3 Biochemical reaction

Similarly to metabolites, MetaNetX is a great resource for biochemical reactions. Likewise, the identifiers easiest to interpret for human beings are BiGG symbols.

We will use [phosphofructokinase](#) as an example.

```
[33]: reaction = cobra.Reaction("PFK")
```

```
[34]: bare.add_reactions([reaction])
```

```
<reaction metaid="meta_R_PFK" id="R_PFK" reversible="false" fast="false" fbc:lowerFluxBound="c
```

As you can see, by default, the reaction identifier is prefixed with R_.

1.3.1 Human readable, descriptive name

```
[35]: reaction.name = "phosphofructokinase"
```

Similarly to metabolites, you can also inspect existing reactions on models.

```
[36]: p_falciparum.reactions.PFK
```

```
[36]: <Reaction PFK at 0x116cb8940>
```

1.3.2 Reaction formula

We create a few metabolites just for the purpose of this example reaction.

```
[37]: bare.add_metabolites([
    cobra.Metabolite("adp_c", compartment="c"),
    cobra.Metabolite("h_c", compartment="c"),
    cobra.Metabolite("fdp_c", compartment="c"),
    cobra.Metabolite("atp_c", compartment="c"),
    cobra.Metabolite("f6p_c", compartment="c"),
])
```

```
atp_c + f6p_c ==> adp_c + fdp_c + h_c
```

```
[38]: reaction.reaction = "atp_c + f6p_c <=> adp_c + fdp_c + h_c"
```

You can see above for the existing PFK reaction that it was parametrized differently: it is irreversible (proceeding only in one direction).

A reaction formula is automatically translated into stoichiometric coefficients and flux bounds. This can be modified at any point before, during, or after creation of the reaction.

```
[39]: reaction.metabolites
```

```
[39]: {<Metabolite atp_c at 0x116ee0048>: -1,  
      <Metabolite f6p_c at 0x116ee06a0>: -1,  
      <Metabolite adp_c at 0x116ee05c0>: 1,  
      <Metabolite fdp_c at 0x116ee0320>: 1,  
      <Metabolite h_c at 0x116ee03c8>: 1}
```

```
[40]: reaction.bounds
```

```
[40]: (-1000.0, 1000.0)
```

1.3.3 At least one database identifier from a reliable resource

Unfortunately, there is rarely a one-to-one relation between identifiers.

```
[41]: reaction.annotation["bigg.reaction"] = "PFK"  
      reaction.annotation["rhea"] = ["16109", "16110", "16111", "16112"]
```

1.3.4 EC number

Just a reminder, ‘EC’ stands for ‘Enzyme Commission’. At the risk of stating the obvious, only enzymes will have EC numbers and so a model is not expected to have an EC number for every reaction. Transporters, exchange reactions, and pseudoreactions will not have this annotation field.

```
[42]: reaction.annotation["ec-code"] = "2.7.1.11"
```

After adding all of this information, the metabolite SBML definition looks like:

```
<reaction metaid="meta_R_PFK" id="R_PFK" name="phosphofructokinase" reversible="true" fa  
  <annotation>

1.3.5 SBO

SBO terms for reactions are extremely useful in order to clearly distinguish a few categories of reactions without having to rely on naming conventions.

- Typical biochemical reactions should be annotated with [SBO:0000176](#) or better yet with one of the more specific child terms.
- Transport reactions should receive [SBO:0000655](#) or a more specific term. This obviates the need to append a `t` to a reaction identifier, as is often done for BiGG reactions such as [PHEMEt](#).
- Exchange reactions should be annotated with [SBO:0000627](#) rather than solely relying on an `EX_` identifier prefix.
- Demand reactions should be annotated with [SBO:0000628](#) rather than solely relying on a `DM_` identifier prefix.
- Sink reactions should be annotated with [SBO:0000632](#) rather than solely relying on an `SK_` identifier prefix.
- The ATP maintenance reaction should be labelled with [SBO:0000630](#).
- All biomass reactions if any exist should be annotated with [SBO:0000629](#).

1.4 Gene

Gene resources depend a lot on your organism. You may find information on [MetaCyc](#), KEGG, NCBI, or more specialized databases. For *p_falciparum*, we are using [plasmodb.org](#), a malaria-parasite database that is part of the EuPathDB project. Many automatic reconstruction pipelines will take a genome identifier and include genes for you in the draft reconstruction.

Genes are also defined in the `fbv` SBML package. The corresponding element is called `geneProduct`. We will use one of the [genes encoding for PFK](#) as an example.

```
[43]: gene = cobra.Gene("PF3D7_1128300")
```

```
[44]: bare.genes.append(gene)
```

This leads to the creation of the following SBML element in the `fbv:listOfGeneProducts`:

```
<fbv:geneProduct metaid="meta_G_PF3D7_1128300" fbv:id="G_PF3D7_1128300" fbv:label="G_PF3D7_1128300">
```

1.4.1 Name and/or identifier

```
[45]: gene.name = "6-phosphofructokinase"
```

1.4.2 DNA sequence ID

```
[46]: gene.annotation["refseq"] = "NC_037282.1"  
gene.annotation["ncbigene"] = "810841"
```

1.4.3 Protein sequence ID

```
[47]: gene.annotation["ncbiprotein"] = "XP_001347965.1"
```

1.4.4 Position (including chromosome, if applicable)

```
[48]: gene.notes["Location"] = "Chromosome: 11; NC_037282.1 (1098167..1103555,␣  
→complement)"
```

The full geneProduct definition now looks like:

```
<fbc:geneProduct metaid="meta_G_PF3D7_1128300" fbc:id="G_PF3D7_1128300" fbc:name="6-phosphofructokinase">  
  <notes>  
    <html xmlns="http://www.w3.org/1999/xhtml">  
      <p>Location: Chromosome: 11; NC_037282.1 (1098167..1103555, complement)</p>  
    </html>  
  </notes>  
  <annotation>  
    <rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#" xmlns:dcterms="http://purl.org/dc/terms">  
      <rdf:Description rdf:about="#meta_G_PF3D7_1128300">  
        <bqbiol:is>  
          <rdf:Bag>  
            <rdf:li rdf:resource="https://identifiers.org/refseq/NC_037282.1"/>  
            <rdf:li rdf:resource="https://identifiers.org/ncbigene/810841"/>  
            <rdf:li rdf:resource="https://identifiers.org/ncbiprotein/XP_001347965.1"/>  
          </rdf:Bag>  
        </bqbiol:is>  
      </rdf:Description>  
    </rdf:RDF>  
  </annotation>  
</fbc:geneProduct>
```

1.4.5 SBO

There is only one relevant term for genes [SBO:0000243](#) but other elements such as mRNA also have terms.

1.4.6 Associated reactions (GPR)

In cobrapy, the association between gene, protein, and reaction (GPR) is set on the reaction object. This is currently set as a Boolean rule of gene identifiers. We will generate a rule here that encodes two isozymes (two independent proteins that can catalyze the reaction) in order to show a simple Boolean rule.

```
[49]: reaction.gene_reaction_rule = "PF3D7_1128300 or PF3D7_0915400"
```

```
[50]: gene.reactions
```

```
[50]: frozenset({<Reaction PFK at 0x116ecb2e8>})
```

Adding the GPR to the PFK reaction expands its SBML definition by the following:

```
<fbc:geneProductAssociation>
  <fbc:or>
    <fbc:geneProductRef fbc:geneProduct="G_PF3D7_1128300"/>
    <fbc:geneProductRef fbc:geneProduct="G_PF3D7_0915400"/>
  </fbc:or>
</fbc:geneProductAssociation>
```

1.5 Save Model

```
[51]: write_sbml_model(bare, "bare.xml")
```

You can now inspect the full SBML definition for our minimal model. Generating all the annotations manually required quite a bit of online research in different databases. We would like to emphasize that a good reconstruction tool will provide you with a lot of this information thus saving you a lot of tedious annotation work. However, if you ever get tired of annotating your model, please consider that you doing it once correctly for your reconstruction will provide great value to the countless researchers applying your model in other scenarios.
